

Project Overview Document

Title:

Random Anime Suggestion Program

Code:

WWAL1

Purpose:

To create a simple program that can suggest anime titles randomly to the user.

Goals:

- To enhance my skills as a programmer.
- To work on real, practical projects instead of only theory.
- To create a program that is useful for myself and potentially for others.
- To build a basic structure that can be improved and expanded with more features over time.

Functionality

| Feature | Description |
|-----------------------------|--|
| Random Suggestion | Selects one anime at random from a list and displays it. |
| External File Use | Uses a .txt file to store anime names; one anime per line. |
| No User Input Needed | The program runs and immediately prints a suggestion. |

we can work on inputs when we have more features to avail.

Structure of Program

```
anime_suggester/  
├─ anime_list.txt      # List of anime titles  
└─ main.py            # Main script that loads and suggests
```

⚙️ How It Works (Logic Flow)

1. Load the list of anime titles from anime_list.txt.
2. Remove any blank lines or spaces.
3. Use Python's random.choice() to pick one title.
4. Display the result in the terminal as:
"Suggested anime: <title>"
